Ensemble Member

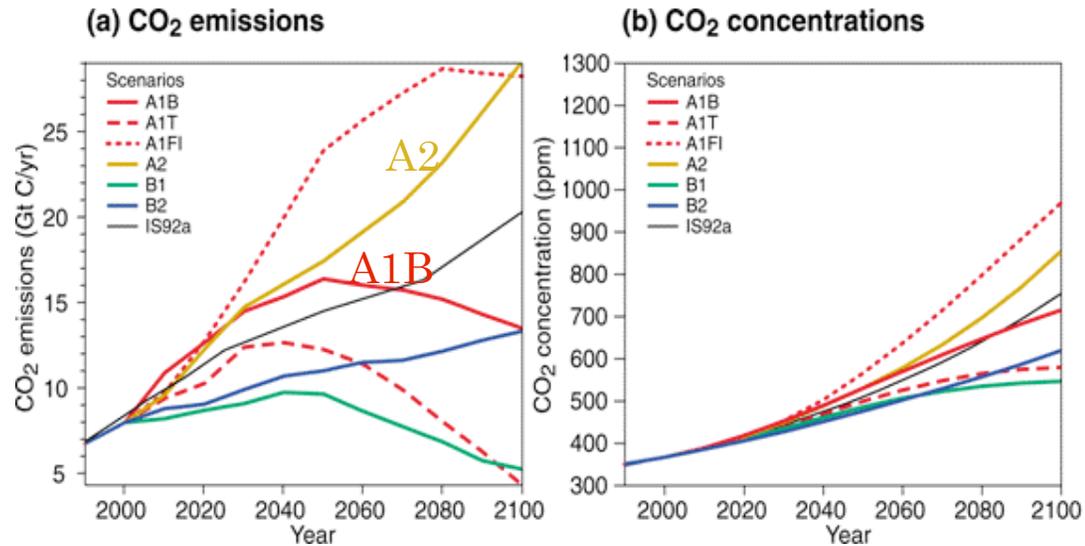

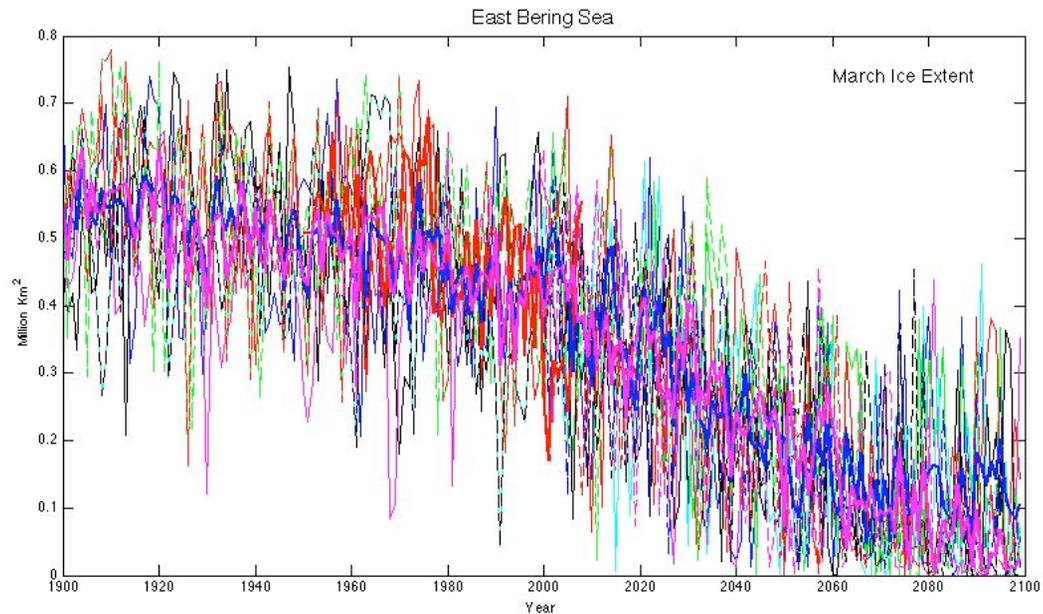

Made with the same model but different initial conditions only characterize the uncertainty associated with internal climate variability (natural variation).

Ensemble Mean

The average of the ensemble members (runs) from one model or a group of models.

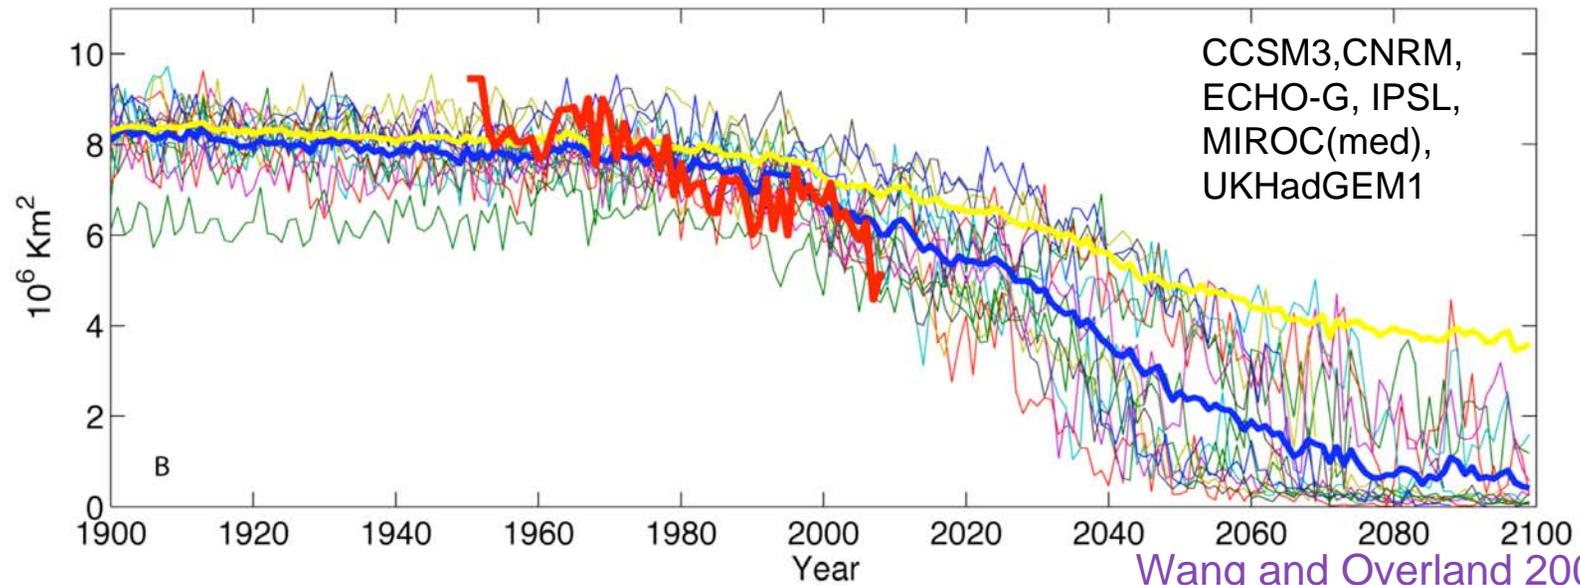

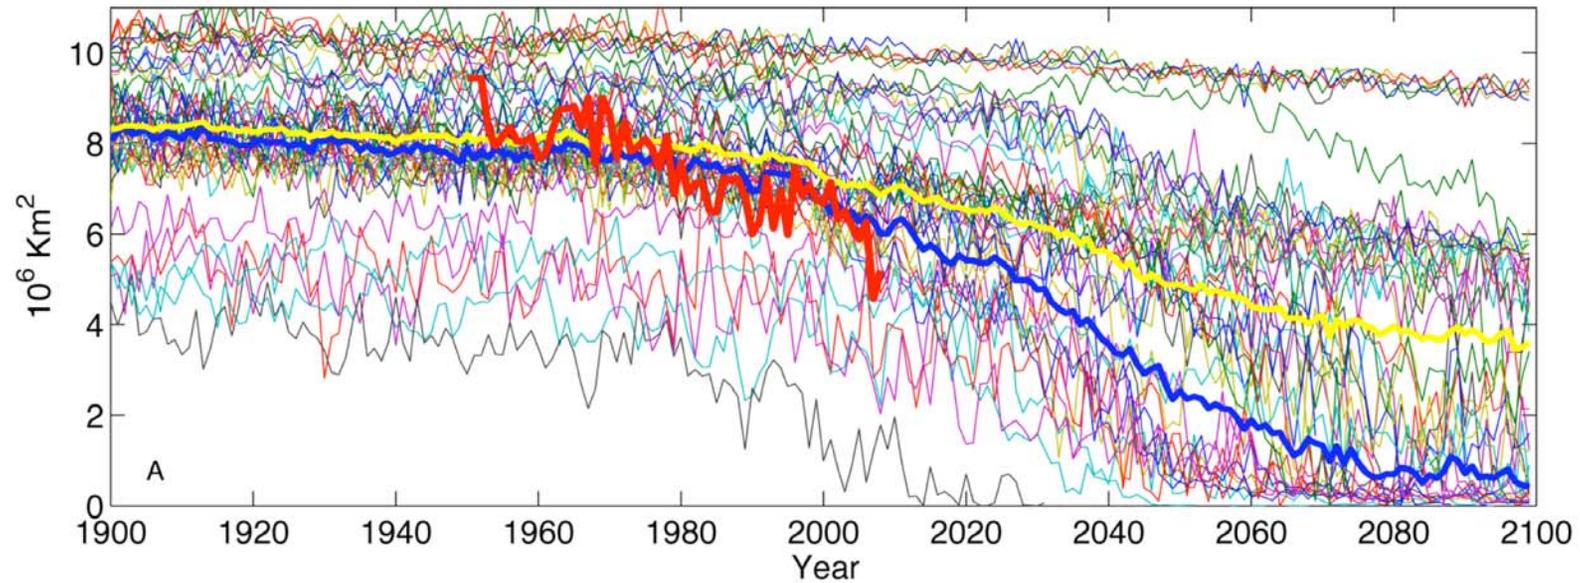

Emission Scenarios

A plausible representation of the future development of emissions of substances that are potentially radiatively active.

SUMMARY

- Linear decline trend is projected by climate models for both Bering Strait (Dec.) and East Bering Sea.
- Larger declining trend in Fall and Spring indicating that the ice season will be shorter over the Bering Sea.
- There is a large interannual variability in the Bering Sea ice extent, which will continue in the next 50 years.
